

ABSTRACT OF THE DISCLOSURE

A compact foldable skateboard comprises a central board portion, a front board portion and a rear board portion. The front board portion and the central board portion are connected one to the other in rear edge to front edge relation, by a hinge, for longitudinal folding movement between a flat in-use configuration and a folded storage configuration. The rear board portion and the central board portion are connected one to the other in front edge to rear edge relation, by a hinge, for longitudinal folding movement between a flat in-use configuration and a folded storage configuration. In a flat in-use configuration, the front board portion, the rear board portion and the central board portion are vertically and horizontally aligned one with the other. In a folded storage configuration, the front board portion and the central board portion face each other.
